

# Welcome to Turbo Git

Before using Turbo Git, you must prepare a few things. Its very easy and will be over in a few seconds.

If you have used Git before start with **Credential Manager**. If you have never used Git ever start with **Install Git**.

**Attention:** If you use a second authenticator for your GitHub, this Tool will not work, so please remove it. Please attention that everything is the same and correctly and also case sensitivity!

## **Credential Manager**

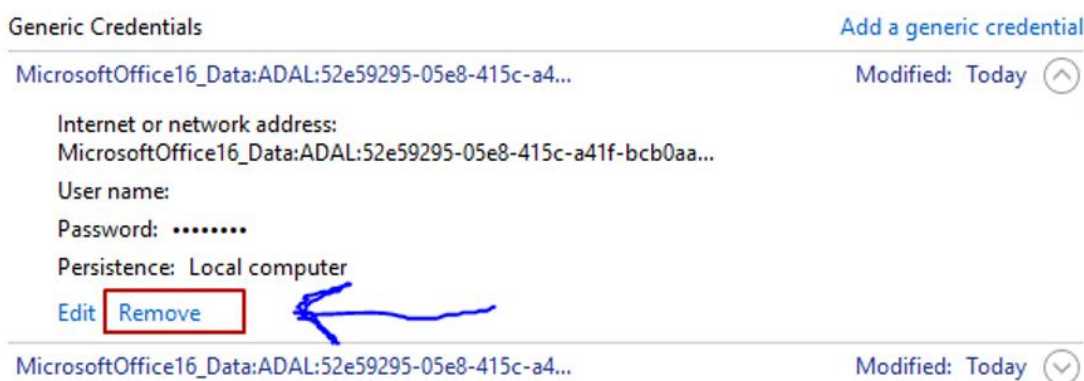

### Step 1

1. To open Credential Manager, type **credential manager** in the search box on the taskbar and select **Credential Manager Control panel**.
2. Select **Web Credentials** or **Windows Credentials** to access the credentials you want to manage.

### Step 2

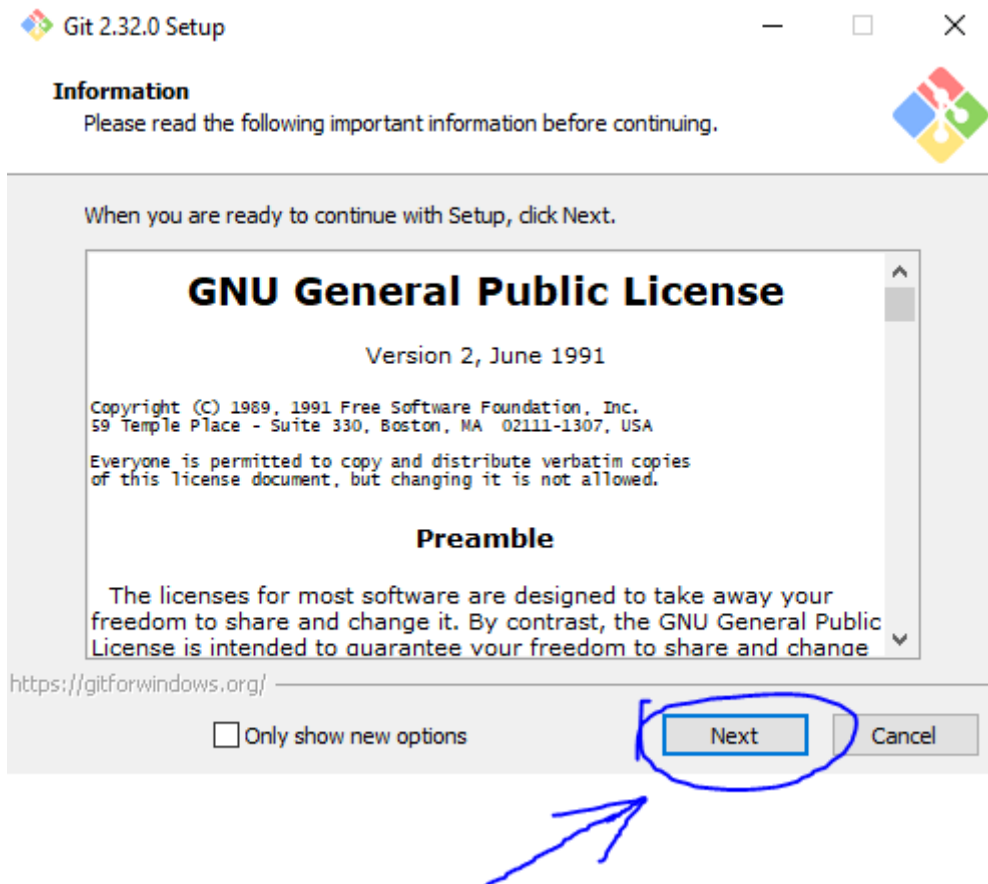

1. Blow in the **Generic Credentials** search for all **GitHub** related names and “delete” them all.
2. After doing that “click” on the **Add a certificate-based credential** button.
3. A popup window will show up asking for some information’s like below.

## Install Git

### Step 1

1. Go to <https://git-scm.com/downloads> website and download the latest Git.
2. All you have to do is let everything as it is with default options and just click next until the Git installation is ready.
3. After Git is installed “restart” your pc and enjoy using Turbo Git.

### Remember:

Everything in Turbo Git is with comments and tool tips! If you are not sure what to do, just go with your mouse pointer on following labels or buttons.

**Good Luck!**
